Project Details:

Copy the details from the pre-defined ideas page.

Title	Food Recipe Tracker
Problem Statement	Many people enjoy cooking but need a convenient way to save, organize, and find recipes. A food recipe app allows users to store favorite recipes, search for them easily, and keep track of ingredients and preparation steps.
Project Idea	Create a food recipe application using HTML, CSS, and JS where users can log, view, and manage recipes. The app will allow users to search and filter recipes by name, ingredients, or category, while providing a dashboard to track saved recipes.
Project Components	• **Recipe List:** ○ View Recipes: Display a list or grid of saved recipes with basic details like recipe name, category (e.g., appetizer, main course, dessert), and cooking time. ○ Recipe Detail Page: Clicking on a recipe shows its full details, including ingredients, preparation steps, cooking time, and serving size. ○ Recipe Image: Users can upload an image/provide a link of the image of the dish or select from pre-defined images to visually represent the recipe. • **Add and Manage Recipes:** ○ Add Recipe: A form allows users to add new recipes by entering details such as recipe name, ingredients, steps, category, and cooking time. ○ Edit/Delete Recipes: Users can edit existing recipes to update details or delete recipes they no longer need. ○ Ingredient List: Each recipe has a detailed ingredient list, with quantities and units (e.g., "2 cups of flour"). ○ Preparation Steps: Users can add or edit step-by-step instructions for how to cook the recipe. • **Search and Filter Recipes:**

	○ Search Bar: Users can search for recipes by name, ingredient, or category. As the user types, the list filters dynamically to display matching results. ○ Filter by Category: A filter feature allows users to view only specific types of recipes, such as "Desserts," "Main Courses," "Vegan," or "Low-Carb." ○ Sort Recipes: Users can sort recipes by cooking time, alphabetical order, or date added. • **Recipe Favorites:** ○ Save Favorite Recipes: Users can mark certain recipes as favorites, and these will appear in a dedicated "Favorites" section. ○ Unfavorite Recipes: Users can remove recipes from the favorites list whenever they want. • **Recipe Dashboard:** ○ Recipe Stats: A dashboard shows the number of recipes saved, the number of categories used, and the most popular recipes based on user interactions (e.g., most favorited). ○ Recently Added Recipes: Display the most recently added recipes on the dashboard for easy access.

Task Planning:

1. Phase-1:

Avoid incorporating generic information, as it may result in penalties. List and divide all the tasks related to Phase-1 Deliverables.

Note: Feel free to delete the column of Student 3 Tasks if you have only 2 members in your team.

Phase-1 Deliverables	Recipe List Add and Manage Recipes Homepage Recipe Dashboard (HTML, CSS)

Mark's Tasks	Dyllon's Tasks	Corbin's Tasks
Task 1 Develop the Food Recipe Tracker homepage using HTML, including the website title, navigation menu, recipe dashboard, and sections for All Recipes, Favorites.	Task 1 Create the JS to make forms to add recipes to the website that include recipe name, ingredients, steps, category, and cooking time.	Task 1: Research and apply how to load and save where user leaves off on a webpage
Task 2 Design the homepage with CSS, including a responsive navigation bar, recipe card layout, background colors, buttons, and spacing for desktop and mobile screens.	Task-2 Have a set of predefined images for the user to choose from to add to their recipes.	Task 2: working on event listener for the recipes so that user can update a recipe by double clicking on it.
Task 3 Create recipe cards that display each recipe's image, name, category, cooking time, and a View recipe	Task-3 Set up a recipe object in JS that stores recipe name, ingredients, steps, category, and cooking time.	Task 3: Working on deleting the recipes that the user has no need for anymore: this can be done with html buttons and java script event listeners

button that opens detailed recipe information.		
Task 4 Build the recipe dashboard showing the total number of saved recipes, number of categories, favorite recipe's, and recently added recipe's.	Task-4 Set up in JS a function that creates recipe cards and places them in at the top of the list of recipes.	Task4 Working on adding and editing step by step by step instructions for the recipe using event listeners in java script
Task 5 Create the recipe details display with a formatted ingredients list, numbered cooking instructions, preparation time, serving size, and recipe image.	Task-5 Set up the HTML and CSS for the recipe details page. Which will include every member of the recipe object.	Task5: Setup the js for the recipe details page working on transferring information from the recipe card to the recipe details page

2. Phase-2:

Avoid incorporating generic information, as it may result in penalties. List and divide all the tasks related to Phase-2 Deliverables.

Note: Feel free to delete the column of Student 3 Tasks if you have only 2 members in your team.

Phase-2 Deliverables	Search and filter Recipes Recipe Favorites Shopping List Recipe Dashboard (JS)		
Student 1 Tasks		Dyllon's Tasks	Student 3 Tasks
Task 1 Design a form using HTML, CSS, and JavaScript that allows users to add their own		Task-1 Setting up dynamic recipe stats in JS that tells the dashboard number of recipes saved, the number of	Task 1: Work on dynamically Searching for a recipe using a form in the navigation bar and traversing through the list of recipe names and

recipe's by entering a recipe name, ingredients, cooking instructions, preparation time, and serving size.	categories used, and the most popular recipes based on user interactions (e.g., most favorited).	filtering out the recipes that do not match the input provided
Task 2 Create filtering options that allow users to organize recipes by categories such as breakfast, lunch, and dinner.	Task-2 Allow users to mark their favorite recipes to be later stored in the favorites section.	Task 2: Create a function that sorts the recipe list by date added. Creating dates upon the 1st time the user creates the recipe and adding that date to the recipe's object. Then sorting the list of recipes by their date having newer ones be displayed at the top of the page
Task 3 Use HTML and JavaScript to allow users to rate recipes from 1 to 5 stars and display the rating on each recipe card.	Task-3 Allow users to deselect a recipe as their favorites and remove it from the favorites section.	Create a function that sorts a list of recipes by alphabetical order with recipes that start with letters more towards the beginning of the alphabet being at the top of the webpage. This can be done by using conditionals and loops in Js
Task 4 Use JavaScript to create a cooking timer that allows users to set a countdown based on the recipe's cooking time. The timer will notify users when the time is finished.	Task-4 Adding dashboard recipe stats dynamically onto the dashboard via HTML.	Create a function that sorts a list of recipes by cooking time with the ones that take the least amount of time at the front and the ones that take the most amount of time at the bottom. Convert the time it takes into minutes and sort using an algorithm like bubble sort
Task 5 Use CSS and Bootstrap to make sure the recipe tracker works properly on computers, tablets, and mobile phones.	Task-5 Create a favorites section that holds the favorited recipes separate from the regular recipe section.	Task 5: implementing a drop-down list for users to choose a sorting method and taking input from the selected value and sorting accordingly

Project Mock-Up Screens:

- Sketch your mock-up screens using pen or pencil on paper. Alternatively, if you prefer digital tools like Figma or draw.io, you may use them.
- Incorporate mock-up screens corresponding to the project components or task list.
- Capture screenshots of your mock-ups and attach them in this section.

[Attach screenshots of mock-up screens here]
